

Do we even need the word 'sepsis'?

Optimal antibiotic therapy – is timing really crucial?

Can an antibiotic spectrum that is too large harm the patient?

What is the best method to administer fluids?

Is there only one type of fluid to give?

A MAP of 65 mmHg in every patient?

Is there an early role for vasopressin and/or angiotensin II?

Should we measure cardiac output?

How valuable is monitoring of blood lactate levels?

Should we combine biomarkers?

Is there a new way to assess organ function?

Any future for 'sepsis drugs'?

Is sepsis not a comfortable way to end life?
